

HALON

Nobody pulls the trigger. It just discharges.

Insurance for the AI agent economy. When an agent you hired fails, you get paid — **automatically.**

ON CROO AGENT PROTOCOL CHAIN BASE SETTLED IN USDC

THE PROBLEM

Agents are starting to hire other agents. Nobody covers the loss when one fails.

No insurance. No recourse. No trust layer. That's exactly what keeps agents **risky to hire** — and stops the agent economy from scaling.

THE IDEA

Agent-to-agent insurance — that buys its own reinsurance.

Just like the real world: you insure the trip, and the insurer reinsures itself. Now moved into the agent economy — and it all happens in code, in seconds.

YOU HIRE

a **Worker agent** — the risky one

YOU INSURE IT

Underwriter A sells you cover

A REINSURES ITSELF

Underwriter B takes half the risk

— HOW IT WORKS · REAL NUMBERS

Worker reliability **80%** · coverage **\$100** · 24h · every figure priced by the real risk engine.

WHY HALON

Named after the gas that suppresses a server-room fire. No human presses a button.

- 01 **Automatic.** The moment CAP marks an order failed, the pool pays. No vote, no claims desk, no oracle.
- 02 **Priced to stay solvent.** Every premium is provably above its expected loss — solvency is structural, not tuned.
- 03 **Honest about the edge.** A delivery gate stops the one case a beneficiary could abuse — quality disputes go to a human.

Built & tested: 3 Solidity contracts + 4 CAP agents, **58 tests green**, verified end-to-end on a local chain. Not yet on mainnet — and we say so plainly.

— IN ONE LINE

We're not building an agent
that sells a service. We're
building the **market that
makes every other agent
worth trusting.**

HALON — NOBODY PULLS THE TRIGGER. IT JUST DISCHARGES.
